SUMMARY

I'm a Frontend Developer with nearly a year of freelance experience delivering responsive, real-world web applications. I specialize in building modern UIs using React, Next.js, and TypeScript. I regularly work with tools like React Query, Redux Toolkit Query, and Tailwind CSS to create fast, user-friendly products.

EXPERIENCE (freelance)

European Pro League - https://eplesports.com   4 months
Description:
I worked closely with a senior developer to build the frontend of a professional esports tournament platform. My contributions included developing key sections such as the Contact page, match detail pages, the Footer, and multiple slider-based content blocks used across the site. Together, we focused on performance and responsiveness for users across devices.
- Developed the Contact page, including layout, responsive design, and data integration.
- Created the Footer with structured navigation, and social media links.
- Built dynamic slider sections (e.g. tournaments, streams, blog posts) using Swiper, optimized for different screen sizes.
- Developed the match/game detail page, displaying team info, match time, and data fetched via React Query.

Tech Stack: Next.js, TypeScript, Tailwind CSS, React Query, Swiper

SHOTEAM App - https://t.me/shoteamstore_bot   2 months
Description:
Developed a responsive Telegram Mini App for a private marketplace system — not just a simple bot, but a full-featured web application launched inside Telegram. The app includes balance management, product categories, purchase history, and more.
- Built full UI using React, TypeScript and styled it with Tailwind CSS, using clsx and tailwind-merge for cleaner class handling.
- Implemented pagination using React Router DOM, allowing smooth navigation between category pages.
- Used Redux Toolkit Query (RTK Query) for data fetching, with caching and pessimistic updates to improve performance and consistency.
- Created key features: shopping cart, referral system, bonus tracking, and payment flow with multiple providers.

Tech Stack: React, Redux Toolkit Query, React Router DOM, Tailwind CSS, clsx, tailwind-merge

Inventory and Order System   3 months
Description:
Created a web application for managing warehouse inventory and tracking product orders. The app helps employees view stock, filter items, check order history, and manage deliveries.
- Built the interface using React and styled it with SCSS.
- Added a calendar for filtering orders by date using react-calendar and react-daterange-picker.
- Used Redux Toolkit to manage app state and RTK Query for data fetching, with caching and pessimistic updates.
- Made forms with React Hook Form and validation with Yup.
- Created shopping cart functionality and balance updates.

Tech Stack: React, Redux Toolkit, React Router DOM, React Hook Form, Yup, SCSS, react-calendar.
